In the trucking industry, XM (satellite) radio has become an invaluable asset to make the long hours between municipalities and local radio stations bearable, and even enjoyable. The advent of the ability to check weather and traffic in major cities is a step in the right direction in making dispatching and scheduling more realistic while trucks, and material, are still many hours or days away from their final destination. Please do not limit XM (satellite) radio from bringing programming to subscribers, even if local Am & FM stations feel it is an infringement on their "territory".
